Abstract

Customer focus and increased harvest productivity were the main objectives for the improvements made to the 2010 7460 cotton stripper.

Those changes included EPA Tier 3 emission compliance, improved cotton material flow, engine power increase, dual burr extraction chutes, relocating header height control, an increase in rated engine/cleaner/header speed, adding an isochronous engine governing curve, improved hydrostatic acceleration, tri-state throttle and improved service life on air filter. Additionally, optional equipment available for the 2010 7460 includes header float and camera kit.
