Abstract

CroPMan is a windows-based application of **EPIC** (Environmental/Policy Integrated Climate model) originally developed by USDA-ARS that simulates the interaction of natural resources (soil, water, climate) and crop management practices to estimate impacts on harvested crop yield, soil properties, soil erosion, profitability, and nutrient/pesticide fate. It is designed as a production-risk management aid to help agricultural practitioners optimize crop management and maximize production and profit, to identify limitations to crop yield, to assist growers with replant decisions, and to identify best management practices that minimize impact of agriculture on soil erosion and water quality. **CroPMan** is distributed on CD-ROM and operates under *Windows*® 98 and 2000 with 64 MB RAM. It is installed on a hard-drive (using 250 MB minimum). The databases for basic model operation are organized by agricultural region and contain baseline information for model operation so the user can perform basic operations with minimum effort, but the user can customize this information for his/her site-specific conditions and needs. Databases for model operation are currently available for Texas and Missouri, but can be constructed for other agricultural regions upon request and operation.

Overview of CroPMan Model

Management Practices Simulated:

- Fertilization: N and P (mineral, manure)
- Planting date, crop maturity, crop type, and rotation sequence
- Irrigation
- Plant population & Row spacing
- Tillage/ residue management
- Pesticide (economics and fate)

Databases included:

- Weather: observed daily maximum and minimum temperature and precipitation and monthly statistics from selected class 1 or coop weather sites to operate weather generator
- Soils 5, Management Unit Use Files by County
- Pesticides, Fertilizers & Equipment
- Management: sequential farming operations by cropping system: crop, tillage (conventional, reduced, and no-till), and water application (irrigation versus dryland)

Special Features:

- Unit Conversion: English/Metric
- Generates daily weather from monthly statistics if daily weather data are missing
- Update/ modify soils, weather, crop growth, and management to current conditions
- Performs direct comparisons of soil type/characteristics, cropping systems, management practices to identify best opportunities over- and within- cropping season.
- Information saved and sorted by Producer name, Soil, County, Weather Station, Cropping System, Farm, Field, and Management unit.
- Built in utility to update daily weather records to current day from user collected/supplied daily records.

Applications:

Strategic Assessments (over years)

- Examine production practices for site-specific climate and soil variation to identify production constraints and maximize yield, profit, and production efficiency.
- Assess fertility requirement, and nutrient and pesticide fate

- Identify the “Best Management Practices” for site-specific circumstances to minimize cropping impact on soil erosion, water quality, and runoff.
- Assess climate impacts on productivity: El Nino/La Nina

Real-time Analyses (current year)

- Late planting options (maturity/crop type)
- Replant decisions
- Fertilizer optimization
- Irrigation timing and amount
- Estimate yield & profit
- Nutrients/pesticides in runoff

Output: Graphical/numeric display, hard copy, or saved to digital file

<i>Economics:</i>	<i>Nutrient balance:</i>
Operation, Fixed, & Total Costs	Phosphorus mineralized
Gross Returns	Phosphorus applied
Cash Flow	Nitrogen applied
Profit	Lime applied
	Organic carbon in plow layer (6")
	Organic carbon in soil profile
<i>Stresses:</i>	
Drought	
Low Temperature	
Excess Water	<i>Non-point Losses:</i>
Nitrogen	Soil loss (water erosion – small watershed)
Phosphorus	Soil loss (wind erosion)
	Soluble phosphorus loss in runoff
	Phosphorus in percolate
<i>Crop yield:</i>	Phosphorus loss with sediment
Biomass	Organic nitrogen loss with sediment
Yield (grain, forage and/or lint yield)	Soluble N in surface runoff
Nitrogen in yield	Mineral N loss in lateral subsurface flow
Phosphorus in yield	
	<i>Pesticide losses:</i>
<i>Water balance:</i>	Biodegraded (foliage)
Precipitation	Biodegraded (soil)
Surface runoff	In drainage system
Water use efficiency	Remaining In soil (EOM: end of month statistics)
Evapotranspiration	Losses by leaching
Irrigation applied	Losses in runoff
Crop available water	Losses in sediment
Percolation below root zone	Remaining On foliage (EOM: end of month statistics)
Lateral subsurface flow	
	<i>Other:</i>
	Planting date
	Emergence date and Harvest date

CroPMan Input and Output Screens

Figure 1. CroPMan standard run screen.

Figure 2. CroPMan customize run screen.

Type	Operation	Year	Month	Day	Type	Applied	Rate
Plant/Calculate/Other	Plant/Calculate/Other	2000	August	30			
Plant/Calculate/Other	Plant/Calculate/Other	2000	September	1			
Plant/Calculate/Other	Plant/Calculate/Other	2000	October	30			
Plant/Calculate/Other	Plant/Calculate/Other	2000	November	30			
Fertilizer	Fertilizer	2000	November	30	Elemental Nitrogen	42.11 lb/acre	
Fertilizer	Fertilizer	2000	February	22	14-00-26 N-P-K	123.79 lb/acre	
Pesticide	Pesticide	2000	March	1	1,4-DECA	3.37 gal/acre	
Plant/Calculate/Other	Plant/Calculate/Other	2000	March	1			2000 plants/acre
Plant	Plant	2000	March	30			
Plant/Calculate/Other	Plant/Calculate/Other	2000	April	1			
Plant/Calculate/Other	Plant/Calculate/Other	2000	May	1
